## Table of contents

**Estimating Attendance Rates** summarizes a complementary analysis contingent on the weaker assumption that attendance is independent of race, conditional on acceptance and other observed student characteristics.

Table [S1](#) shows the proportion of publicly reported applications reported by the institutions in the main analysis that were submitted via the national postsecondary application platform.

Table [S2](#) shows summary statistics for applicants from high schools with reliable and unreliable records of sent transcripts.

Table [S3](#) shows summary statistics for white, East Asian, South Asian, and Southeast Asian applicants in the study pool.

Table [S4](#) lists relevant covariates observed and unobserved by the authors and by the application platform.

Tables [S5](#) through [S12](#) list and describe the covariates used in the main model specifications.

Tables [S13](#) through [S15](#) describe robustness checks of the main model specification.

Table [S17](#) replicates the main results using an expanded set of selective schools.

Table [S18](#) replicates the main results using an interaction between ethnicity and reported sex.

Tables [S20](#) through [S26](#) show the number of applicants in various coarsened groups defined by race and ethnicity, test score, legacy status, region of the country, and enrollment signal.

Table [S27](#) displays the data used to construct Figures 3, [S1](#), and [S2](#).

Figures [S1](#) through [S3](#) show robustness checks of the state-level analysis in the main text.

Figures [S4](#) and [S5](#) support the hypothetical admissions policy results in the main text.

Figure [S6](#) shows differences in legacy prevalence among students of different race and ethnic groups across a large group of selective schools.

Figure [S7](#) displays the ethnicity of high-scoring white- and Asian-identifying applicants, disaggregated by international applicant status.

Figure [S8](#) shows how often parents attended international or U.S.-based colleges, disaggregated by ethnicity.

## Estimating Attendance Rates

In the Discussion, we speculate that students who were admitted to an Ivy-11 would have a high probability of attendance. In this way, one might infer admissions decisions from reported attendance.—which we can in turn accurately impute by looking at the institution to which a student sent their final high school transcript. Here we describe an alternative estimation strategy that holds under the weaker assumption that enrollment choices are independent of race conditional on acceptance and other observable student characteristics.

Denote by  $A$  the event that a particular applicant is admitted to an Ivy-11, where  $A = 1$  if the applicant is admitted and  $A = 0$  if the applicant is not admitted. Denote by  $E$  the analogous attendance event. Finally, denote by  $R$  the race of the applicant, and by  $W$  a set of non-race covariates. Now, suppose we are interested in comparing the admission probability of an applicant with race  $R$  and another applicant of race  $R'$  with identical non-race covariates  $W$ . We can express this comparison as a risk ratio:

$$\frac{\Pr(A = 1 \mid W, R')}{\Pr(A = 1 \mid W, R)}.$$

Without observing admission outcomes, the above ratio cannot be estimated directly. But, suppose we assume that  $E \perp\!\!\!\perp R \mid A = 1, W$ . In other words, conditional on acceptance and all observed non-race covariates, the decision to attend an Ivy-11 schools is independent of race. Then,

$$\begin{aligned} \Pr(E = 1 \mid W, R) &= \Pr(A = 1 \mid W, R) \cdot \Pr(E = 1 \mid A = 1, W, R) \\ &= \Pr(A = 1 \mid W, R) \cdot \Pr(E = 1 \mid A = 1, W), \end{aligned}$$

and so

$$\Pr(A = 1 \mid W, R) = \frac{\Pr(E = 1 \mid W, R)}{\Pr(E = 1 \mid A = 1, W)}.$$

Applying this result to the acceptance risk ratio:

$$\begin{aligned} \frac{\Pr(A = 1 \mid W, R')}{\Pr(A = 1 \mid W, R)} &= \frac{\Pr(E = 1 \mid W, R')}{\Pr(E = 1 \mid A = 1, W)} \cdot \frac{\Pr(E = 1 \mid A = 1, W)}{\Pr(E = 1 \mid W, R)} \\ &= \frac{\Pr(E = 1 \mid W, R')}{\Pr(E = 1 \mid W, R)}. \end{aligned}$$

Thus, by assuming that attendance is independent of race conditional on acceptance and non-race covariates, we can estimate the acceptance ratio using only data on attendance. Averaging over  $W$ , we have

$$\sum_W \frac{\Pr(A = 1 \mid W, R')}{\Pr(A = 1 \mid W, R)} \cdot \Pr(W) = \sum_W \frac{\Pr(E = 1 \mid W, R')}{\Pr(E = 1 \mid W, R)} \cdot \Pr(W). \quad (1)$$

Importantly, the right-hand side of Eq. (1) can be estimated directly from records of attendance, as done with the main models in our analysis (Table 1). In particular, take  $R$  to be white students and  $R'$  to be, in turn, the three Asian subgroups we consider. Then, after adjusting for test scores, GPA, and extracurricular activities (i.e., by using Model 4 in the main text), we estimate that the average acceptance ratio is 0.58 for South Asian applicants, 0.85 for East Asian applicants, and 0.89 for Southeast Asian applicants. These estimates align with the results we report in Table 1, corroborating our main analysis.

|   | Academic year | Proportion |
|---|---------------|------------|
| 1 | 2015-2016     | 99%        |
| 2 | 2016-2017     | 98%        |
| 3 | 2017-2018     | 96%        |
| 4 | 2018-2019     | 93%        |
| 5 | 2019-2020     | 92%        |

**Table S1.** Approximate proportion of all publicly reported applications to Ivy-11 colleges that were submitted via the application platform, by academic season. The share of applications submitted via the platform has decreased in recent years as alternative platforms have become more popular.

| Variable                           | All     | Included | Excluded |
|------------------------------------|---------|----------|----------|
| Tot. applicants                    | 444,420 | 292,795  | 151,625  |
| Prop. sent transcript              | 10%     | 12%      | 7%       |
| Prop. white                        | 64%     | 64%      | 66%      |
| Prop. Asian American               | 36%     | 36%      | 34%      |
| Prop. East Asian                   | 17%     | 18%      | 15%      |
| Prop. South Asian                  | 12%     | 12%      | 12%      |
| Prop. Southeast Asian              | 6%      | 6%       | 8%       |
| Mean num. apps submitted anywhere  | 7.9     | 8.4      | 7.1      |
| Mean num. apps submitted to subset | 2.3     | 2.3      | 2.2      |
| Prop. applied early                | 39%     | 42%      | 34%      |
| Prop. w/ legacy                    | 6%      | 7%       | 3%       |
| Mean ACT score                     | 32.1    | 32.4     | 31.4     |
| Prop. unreported ACT               | 14%     | 14%      | 13%      |
| Mean standardized GPA              | 0.8     | 0.8      | 0.8      |
| Prop. unreported GPA               | 14%     | 16%      | 10%      |
| Mean num. AP tests                 | 4       | 4.1      | 3.8      |
| Median activity hours              | 3196    | 3236     | 3107     |
| Median sports hours                | 480     | 540      | 400      |
| Prop. female                       | 53%     | 53%      | 54%      |
| Prop. first generation             | 14%     | 12%      | 19%      |
| Prop. using fee waiver             | 15%     | 12%      | 20%      |
| Prop. rural HS                     | 6%      | 4%       | 9%       |
| Prop. private HS                   | 22%     | 27%      | 13%      |
| Median grad. class size            | 333     | 319      | 366      |
| Prop. from California              | 17%     | 16%      | 19%      |
| Prop. from Texas                   | 5%      | 4%       | 6%       |
| Prop. from Florida                 | 3%      | 3%       | 4%       |
| Prop. from New York                | 13%     | 15%      | 9%       |

**Table S2.** Summary statistics for the ‘Included’ applicants who attend high schools with reliable transcript-sending behavior, the ‘Excluded’ applicants who do not, and the combined set of ‘All’ applicants. On average, the ‘Included’ applicants submit more applications, apply early with a greater likelihood, are more likely to have legacy status, have higher standardized test scores, have more extracurricular hours, are more likely to play sports, are less likely to use application fee waivers, are more likely to attend urban and private high schools, and have smaller graduating class sizes. We re-run the main regression by inversely weighting the probability that a given applicant attends a high school with reliable transcript behavior, finding qualitatively similar results (Tables S13-S15, ‘Reweighted’ model variant).

| Variable                           | All     | White   | Asian   | E Asian | S Asian | SE Asian |
|------------------------------------|---------|---------|---------|---------|---------|----------|
| Tot. applicants                    | 292,795 | 186,079 | 106,716 | 53,856  | 36,389  | 16,471   |
| Prop. sent transcript              | 12%     | 12%     | 13%     | 16%     | 10%     | 8%       |

| Prop. rural HS                     | 4%      | 5%      | 1%      | 2%      | 1%      | 2%       |
| Prop. private HS                   | 27%     | 31%     | 20%     | 20%     | 17%     | 23%      |
| Median grad. class size            | 319     | 280     | 400     | 400     | 403     | 372      |
| Prop. from California              | 16%     | 11%     | 24%     | 26%     | 16%     | 31%      |
| Prop. from Texas                   | 4%      | 3%      | 5%      | 4%      | 7%      | 5%       |
| Prop. from Florida                 | 3%      | 3%      | 2%      | 1%      | 3%      | 3%       |
| Prop. from New York                | 15%     | 14%     | 15%     | 17%     | 13%     | 12%      |

**Table S3.** Summary statistics for the race and ethnic groups included in the analysis. White applicants are more likely to have legacy status than Asian applicants, have a greater number of extracurricular hours, on average, and are more likely to attend smaller and private high schools. East and South Asian applicants have, on average, higher standardized test scores and take more AP tests than white and Southeast Asian applicants.

|    | Platform and our data  | Platform, but not our data            | Neither platform nor our data    |
|----|--|---------------------------------------|----------------------------------|
| 1  | Unique applicant identifier  | Full name                             | Athletic recruitment eligibility |
| 2  | Gender   | High school transcript(s)             | True admission outcome(s)        |
| 3  | Race, ethnicity, and region(s) of origin   | Academic honors                       | True enrollment outcome(s)       |
| 4  | Age  | Letters of recommendation             | Ratings of admission officers    |
| 5  | Citizenship status   | Essays and written responses          | Alumni interview ratings         |
| 6  | High school name and location  | Intended career                       | Official test scores             |
| 7  | High school graduation date  | College-specific fields (e.g., major) | Family income and assets         |
| 8  | Self-reported test scores  |                                       |                                  |
| 9  | Self-reported GPA, GPA weighting, and class rank   |                                       |                                  |
| 10 | Highest educational attainment of parents  |                                       |                                  |
| 11 | Institutions attended and degrees obtained by parents  |                                       |                                  |
| 12 | Extracurricular categories, years participated, hours participated per year, leadership positions, and free text description |                                       |                                  |
| 13 | Application submission status at individual colleges   |                                       |                                  |
| 14 | Application timing (e.g., restrictive early action)  |                                       |                                  |
| 15 | Application fee waiver status at individual colleges   |                                       |                                  |
| 16 | Receipt(s) of official transcript submission to individual colleges sent via the platform                                    |                                       |                                  |

**Table S4.** Variables observed by the national postsecondary application platform and the authors, only the platform, and neither the platform nor the authors.

|   | Covariate                     | Additional description   |
|---|-------------------------------|--|
| 1 | Intercept                     |  |
| 2 | South Asian                   | Applicant identifies as South Asian  |
| 3 | Southeast Asian               | Applicant identifies as Southeast Asian  |
| 4 | East Asian                    | Applicant identifies as East Asian   |
| 5 | Year by college fixed effects | Term for each combination of selective college applied to and application year, e.g., 'College X 2016' |

**Table S5.** Variables includes in Model 1, 'Basket+year'.

|   | Covariate                              | Additional description                                   |
|---|--|--|
| 1 | Equivalent ACT Composite Score         | If SAT score reported, converted to equivalent ACT score |
| 2 | Equivalent ACT Composite Score Squared |  |
| 3 | Missing ACT Score                      | Student did not report an ACT or SAT score               |

**Table S6.** Variables included in Model 2, ‘SAT/ACT’. Variables from Model 1 are also included.

|    | Covariate                              | Additional description  |
|----|--|---|
| 1  | Standardized GPA                       | GPA standardized by high school and year                              |
| 2  | Missing Cumulative GPA                 | Student did not report a GPA  |
| 3  | Standardized ACT                       |   |
| 4  | Std. Num. AP                           | Standardized number of AP tests taken                                 |
| 5  | Std. Num. Passed AP                    | Standardized number of AP tests with a reported score of 3 or higher  |
| 6  | Std. Num. 5 AP                         | Standardized number of AP tests with a reported score of 5 (maximum)  |

**Table S7.** Variables included in Model 3, ‘GPA+AP+SAT2’. Variables from all prior model are also included. Standardization is by high school-year using all applicants observed by the platform. We standardize by subtracting the sample mean and dividing by the sample standard deviation. Standardized values for high school-years with only one observation are coded as 0. Standardized values are capped at 3 and floored at -3.

|    | Covariate       | Additional description  |
|----|-----------------|---|
| 1  | Archery         | 8 covariates per sport: Log total number of hours participated in sport, binary indicator for leadership role in sport, binary indicator for four years of high school participation in sport, and binary indicator for leadership and four year participation in sport, with separate covariates for JV/Varsity participation and Club participation |

**Table S13.** Robustness checks of the main specification. Each variant of the main specification lists the corresponding value of the exponentiated East Asian coefficient for each of the nine models in the main analysis. Exponentiated coefficients are qualitatively similar across all specifications. **Detailed descriptions of each variant are on the next page.**

Detailed descriptions of each model variant:

- The 'E. Asian and white' variant fits the main specification only on East Asian and white applicants in the study pool, mimicking the effect of interacting race with each variable in the main model.
- The 'Include recruits' specification does not remove applicants who we believe may be recruited athletes.
- The '2015 only' model fits the main model on only the 2015-2016 academic year application data, with a similar interpretation for the other variants whose names end in 'only'.
- The 'Real ACT/GPA' model excludes applicants who do not report an ACT/SAT score and/or a high school GPA.
- The 'ACT  $\geq$  27' model removes applicants with an equivalent ACT below 27, as very few enrollees at Ivy-11 colleges have ACT scores below 27.
- The 'Remove legacy' model removes legacy applicants from the study pool, following a similar model choice in the Harvard v. SFFA court case.
- The 'US-educated parents' model excludes applicants whose parents exclusively attended undergraduate institutions outside of the United States.
- The 'Transcript senders' model includes only those applicants who sent a transcript to a specific college on the platform. These applicants have the strongest attendance signal, as the precision of our transcript-based enrollment heuristic is 97%.
- The 'Regular decision' model excludes applicants who applied early to only one college, sent a transcript to that college, and did not apply anywhere else. This is a likely signal of attendance at the school to which the student applied early.
- The 'No transcript thres.' allows all high school-years to be included in the analysis, and only excludes students with at least one application who sent the same number of transcripts as applications. The '20% transcript thres.' model allows only applicants from high school-years for which less than 20% of applicants who submitted more than one application sent the same number of transcripts and applications. This model also removes all students with more than one application who sent the same number of transcripts as applications. The '0% transcript thres.' model does not allow high-school years with any applicants who submitted more than one application and sent the same number of transcripts and applications.
- The 'Reweighted' model reweights the main model by the inverse likelihood that the given applicant attended a high school-year where no more than 5% of applicants who submitted more than one application also sent the same number of transcripts as applications. The corresponding propensity model is fit using the same covariates as Model 9, excluding the state-year-basket fixed effects.
- The 'Leave one out' variants assess the sensitivity of the Asian region coefficients to the set of 11 schools considered in the analysis. The exponentiated coefficients of the 'Leave one out max' and 'Leave one out min' variants are derived from fitting each model 11 times, where in each iteration we exclude applications from one of the 11 schools from the dataset. For each of the 9 model specifications, we report the maximum and minimum observed values of the exponentiated Asian region coefficient across 11 fitted models associated with each specification.

| Variant               | Region   | White base rate | Basket + year | SAT / ACT | GPA + AP + SAT2 | ECs  | Sex + Fam. | Early app | Legacy | Loc. + HS | All  |

**Table S16.** Replication of the models in Table 1 using only Ivy-11 schools with yield rates of at least 80% for the 2018–2019 application season (<https://www.usnews.com/education/best-colleges/articles/universities-colleges-where-students-are-eager-to-enroll>). To preserve anonymity, we do not reveal the number of included schools that meet this benchmark. The gaps in attendance rates among South and East Asian students relative to white students do not qualitatively differ from the corresponding gaps in the main results. However, the gaps between Southeast Asian students and white students increase substantially. For example, in the most saturated model, the observed gap grows from a statistically insignificant 2% higher odds for Southeast Asian students to a statistically significant 30% higher odds. One possible explanation for this difference is that Southeast Asian students received greater admissions boost from affirmative action policies at the schools with the highest yield rates relative to the Ivy-11 as a whole.

| Outcome: Enrolled at one of 37 selective schools |                   |                   |                   |                   |                   |                   |                   |                   |                   |

**Table S17.** Replication of the models in Table 1 using a larger group of schools. We include 27 of the 30 top national universities as ranked by U.S. News and World Report in 2019, in addition to the top 10 liberal arts colleges as ranked by U.S. News and World Report in the same year. The three excluded schools, UCLA, UC Berkeley, and Georgetown, do not accept applications via the postsecondary application platform. The gaps in attendance rates among Asian American students and white students are qualitatively similar to those in the main results, but the coefficient magnitudes are attenuated. For example, after adjusting for all observed application components, South Asian students have 21% lower odds of attending one of the 37 selective schools than similar white students. For the 11 Ivy-11 colleges in the main analysis, South Asian students have 30% lower odds. We note that the attendance gaps observed for the expanded set of schools are more weakly tied to admissions decisions, as the matriculation rates of the additional schools are substantially lower than those of the Ivy-11. However, that the same attendance gaps persist at a larger set of schools is concerning, and suggests that admissions policies of schools beyond the Ivy-11 might also exert disparate impacts on Asian American applicants.

| Outcome: Inferred enrollment at the Ivy-11 |                   |                   |                   |                   |                   |                   |                   |                   |                   |

**Table S18.** Replication of the models in Table 1 when interacting ethnicity and sex. White male applicants are the base category. Across ethnicities, applicants who identify as female attend an Ivy-11 school at significantly higher rates than male applicants of the same ethnicity with similar application profiles. South Asian and East Asian males have significantly lower odds of attendance than white males with similar application factors, with a larger gap for South Asian males. South Asian females are the only group of female applicants who have lower odds of attendance than white males with similar qualifications. These results complement prior work that has shown that Asian American male applicants may face a larger admissions penalty relative to Asian American female applicants at elite colleges [Arcidiacono et al., 2022].

| Outcome: Inferred enrollment at one of 11 Ivy Plus colleges |                   |                   |                   |                   |                   |                   |                   |                   |                   |

**Table S19.** Replication of the models in Table 1 after disaggregating Asian American applicants into those who identify solely as Asian American, and applicants who identify as both Asian American and white. Among Asian American applicants, 86% identify solely as Asian American, with 14% identifying as both Asian American and white. Of applicants who identify as both Asian American and white, 57% identify as East Asian, 17% identify as South Asian, and 26% identify as Southeast Asian. Across most specifications, applicants who identify as both Asian American and white are significantly less likely than similarly qualified white applicants to attend an Ivy-11 school. However, effect sizes are substantially attenuated relative to applicants who identify solely as Asian American.

| Race  | ZIP 1 | ACT | Non-legacy applicants | Non-legacy enrollees | Legacy applicants | Legacy enrollees |

**Table S20.** Aggregated counts of white applicants and enrollees across groups defined by geography, equivalent ACT score, and legacy status. Attendance is proxied by observing whether a final transcript is sent to an Ivy-11 college. “ZIP 1” refers to the first digit of the student’s high school ZIP code. To preserve confidentiality, legacy and non-legacy applicant cell counts with fewer than 50 applicants are redacted, along with the corresponding count of enrollees. Further, legacy and non-legacy enrollee cell counts of 0 are redacted, along with the corresponding count of applicants.

| Ethnicity | ZIP 1 | ACT | Non-legacy applicants | Non-legacy enrollees | Legacy applicants | Legacy enrollees |
|-----------|-------|-----|-----------------------|----------------------|-------------------|------------------|

**Table S21.** Aggregated counts of Asian American applicants and enrollees across groups defined by geography, equivalent ACT score, and legacy status. Attendance is proxied by observing whether a final transcript is sent to an Ivy-11 college. “ZIP 1” refers to the first digit of the student’s high school ZIP code. To preserve confidentiality, legacy and non-legacy applicant cell counts with fewer than 50 applicants are redacted, along with the corresponding count of enrollees. Further, legacy and non-legacy enrollee cell counts of 0 are redacted, along with the corresponding count of applicants.

| Ethnicity   | ZIP 1 | ACT | Non-legacy applicants | Non-legacy enrollees | Legacy applicants | Legacy enrollees |

**Table S23.** Aggregated counts of Southeast Asian applicants and enrollees across groups defined by geography, equivalent ACT score, and legacy status. Attendance is proxied by observing whether a final transcript is sent to an Ivy-11 college. "ZIP 1" refers to the first digit of the student's high school ZIP code. To preserve confidentiality, legacy and non-legacy applicant cell counts with fewer than 50 applicants are redacted, along with the corresponding count of enrollees. Further, legacy and non-legacy enrollee cell counts of 0 are redacted, along with the corresponding count of applicants.

| Ethnicity  | ZIP 1 | ACT | Non-legacy applicants | Non-legacy enrollees | Legacy applicants | Legacy enrollees |
|------------|-------|-----|-----------------------|----------------------|-------------------|------------------|

| East Asian | 9     | 35  | 4,130                 | 599                  | 198               | 65               |
| East Asian | 9     | 36  | 2,277                 | 521                  | 100               | 43               |

**Table S24.** Aggregated counts of East Asian applicants and enrollees across groups defined by geography, equivalent ACT score, and legacy status. Attendance is proxied by observing whether a final transcript is sent to an Ivy-11 college. “ZIP 1” refers to the first digit of the student’s high school ZIP code. To preserve confidentiality, legacy and non-legacy applicant cell counts with fewer than 50 applicants are redacted, along with the corresponding count of enrollees. Further, legacy and non-legacy enrollee cell counts of 0 are redacted, along with the corresponding count of applicants.

| Ethnicity       | ACT | Non-legacy applicants | Non-legacy enrollees | Legacy applicants | Legacy enrollees |
|-----------------|-----|-----------------------|----------------------|-------------------|------------------|
| White           | 32  | 15,871                | 896                  | 1,415             | 294              |
| White           | 33  | 22,291                | 1,735                | 2,459             | 591              |
| White           | 34  | 25,555                | 3,255                | 3,387             | 1,225            |
| White           | 35  | 21,762                | 4,354                | 3,480             | 1,630            |
| White           | 36  | 7,936                 | 2,338                | 1,613             | 1,021            |
| South Asian     | 32  | 2,372                 | 77                   |                   |                  |
| South Asian     | 33  | 4,158                 | 201                  | 70                | 11               |
| South Asian     | 34  | 6,211                 | 512                  | 123               | 42               |
| South Asian     | 35  | 7,644                 | 1,177                | 159               | 78               |
| South Asian     | 36  | 4,142                 | 1,086                | 73                | 43               |
| Southeast Asian | 32  | 1,303                 | 54                   |                   |                  |
| Southeast Asian | 33  | 1,825                 | 144                  | 51                | 7                |
| Southeast Asian | 34  | 2,029                 | 203                  | 75                | 15               |
| Southeast Asian | 35  | 1,904                 | 345                  | 81                | 32               |
| Southeast Asian | 36  | 701                   | 198                  |                   |                  |
| East Asian      | 32  | 3,557                 | 173                  | 168               | 22               |
| East Asian      | 33  | 5,836                 | 433                  | 268               | 69               |

**Table S27.** Data used to construct Figures 3, S1, and S2.

**Figure S1.** For each U.S. state, estimated rate of attendance at any one of the Ivy-11 colleges for non-legacy white applicants with an ACT-equivalent score at or above 32, with the proportion of high-scoring white and Asian applicants who identify as Asian on the horizontal axis. We report attendance rates of non-legacy white applicants to better isolate the impact of geography on attendance from the potential impacts of legacy status and race itself. Larger point sizes indicate a higher number of high-scoring white and Asian applicants from the state. The red least-squares regression line is weighted by the same count of high-scoring white and Asian American applicants from each state. The blue line excludes applicants from California. States with a greater share of Asian American applicants have, on average, lower attendance rates for high-scoring and non-legacy white applicants. This pattern holds even if applicants from California are excluded. Table S27 displays the data used to construct this plot.

**Figure S2.** For each U.S. state, mean equivalent ACT score among applicants who reported an ACT score, with the proportion of high-scoring white and Asian applicants who identify as Asian on the horizontal axis. Hawaii is excluded from the plot due to its exceptionally high share of Asian American applicants. Hawaii’s mean equivalent ACT score is 31.6. Larger point sizes indicate a higher number of high-scoring white and Asian applicants from the state. The red least-squares regression line is weighted by the same count of white and Asian American applicants from each state. Table S27 displays the data used to construct this plot.

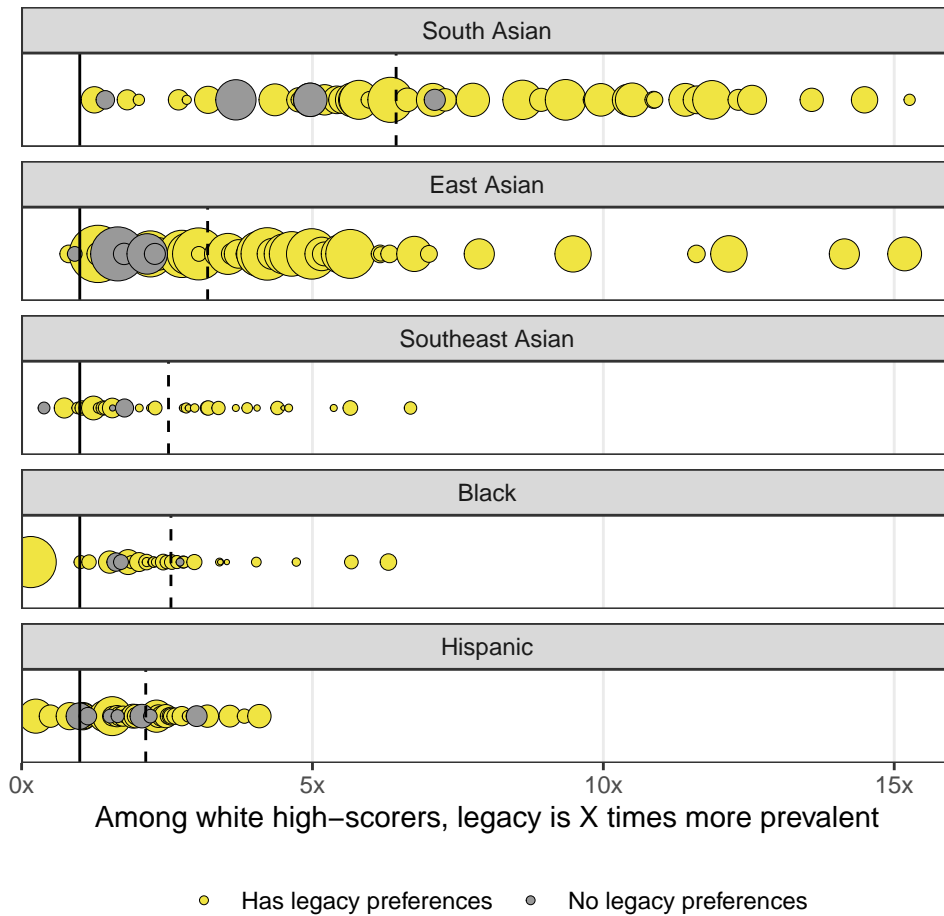

**Figure S3.** For each high school in the study pool, rate of attendance at any Ivy-11 college for non-legacy white applicants with an ACT-equivalent score at or above 32, with the proportion of high-scoring white and Asian American applicants who identify as Asian American on the horizontal axis. We report attendance rates of non-legacy white applicants to better isolate the impact of geography on attendance from the potential impacts of legacy status and race itself. Point sizes are proportional to the number of high-scoring white applicants and Asian applicants to the considered institutions who attend the given high school. The red least-squares regression line is weighted by the same count of high-scoring white and Asian American applicants from the given high school. High schools with a greater share of Asian American applicants have, on average, lower attendance rates for high-scoring non-legacy white applicants.

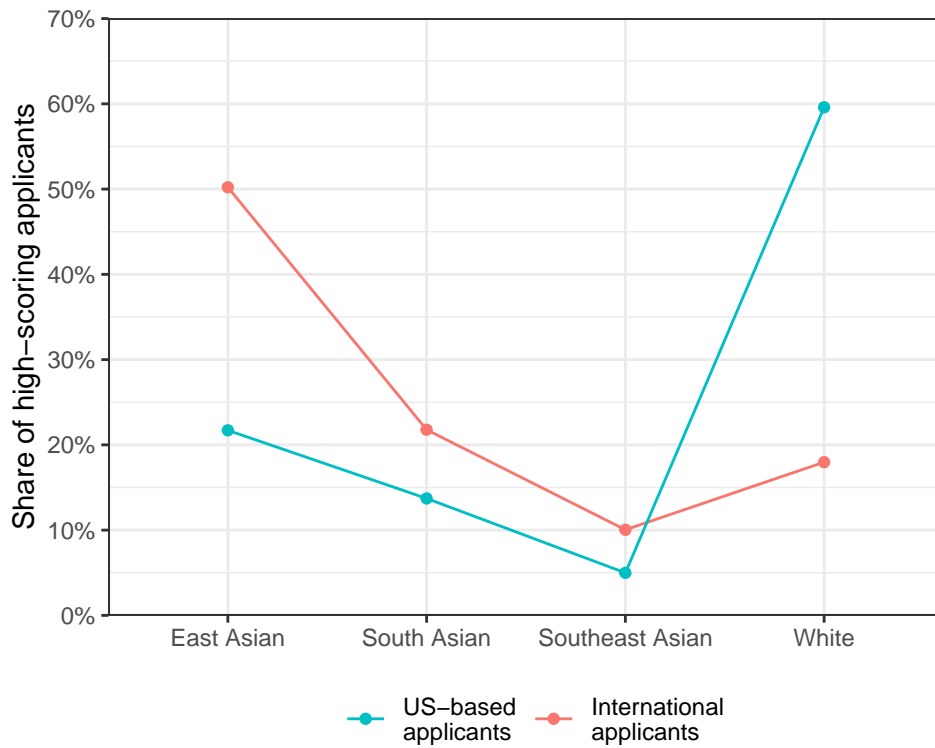

**Figure S4.** Fraction of observed enrollments at Ivy-11 colleges attributed to Asian American and white enrollees. The overall share of enrollments attributed to Asian American and white enrollees decreases slightly over the five years included in the analysis. The hypothetical policies described in the main analysis assume that this share remains approximately constant regardless of application year.

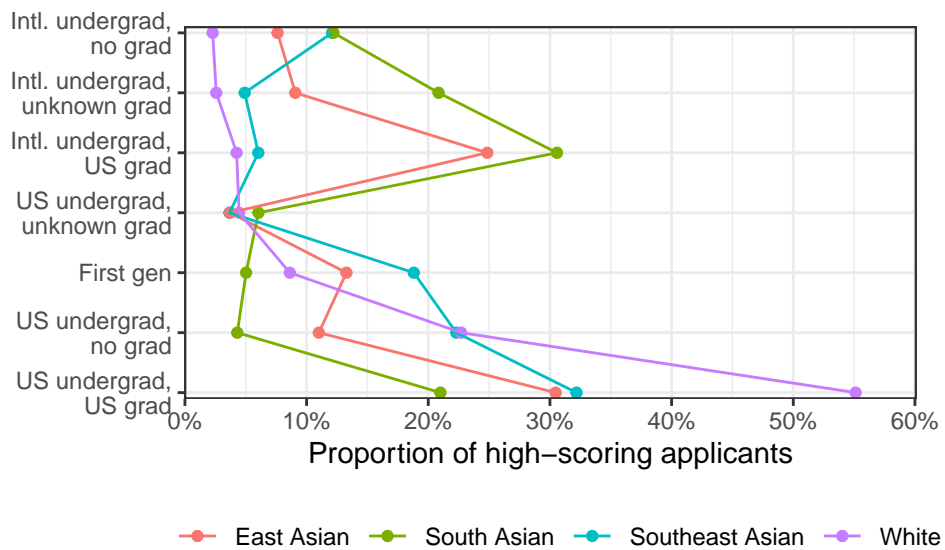

**Figure S5.** The proportion of applicants with one or more parents who attended an Ivy-11 college as an undergraduate, by race/ethnicity and fee waiver status. The pool of applicants in this figure is the same as the main analysis, but does not apply the filters for race or ethnicity. Following the convention of related work, we denote both Black Hispanic and Black non-Hispanic applicants with the label “Black”, with the “Hispanic” label referring to white Hispanic applicants and the “white” label referring to white non-Hispanic applicants. White applicants are the most likely to have legacy status, and Asian American applicants are the least likely to have legacy status.

**Figure S6.** For a large set of selective colleges and universities, ratio of the prevalence of high-scoring white applicants with legacy status divided by the corresponding proportion for applicants who identify with other race and ethnic groups. For example, if 10% of white applicants to a particular school have legacy status, compared to 1% of South Asian applicants, then the ratio for South Asian applicants to that school is 10. The included schools are a combination of selective universities and colleges for which we have application materials, including private universities, public flagship universities, and liberal arts colleges. We define “high-scoring” as having an equivalent ACT score at least as high as the median equivalent ACT score of enrollees. Point sizes are approximately proportional to the number of applications from students of each race and ethnicity. The yellow points indicate schools with publicly-stated legacy preferences in admissions, while the gray points indicate schools that have stated publicly that they do not consider legacy in admissions. Schools with unknown legacy preferences are excluded. Schools with less than 1,000 applicants from the given race or ethnic group are hidden. High-scoring white applicants are, on average, approximately six to seven times more likely to have legacy status than high-scoring South Asian applicants, and two to three times more likely than high-scoring East Asian, Southeast Asian, Black, and Hispanic applicants. These results suggest that legacy preferences may disproportionately benefit white applicants at schools across the country. We note, however, that there is substantial heterogeneity in school-level legacy ratios, so the extent of the benefit likely differs across campuses.

**Figure S7.** Ethnicity of high-scoring white- and Asian-identifying applicants, disaggregated by international applicant status. Applicants from East, South, and Southeast Asia make up a larger share of the international applicant pool than the U.S.-based applicant pool. There is an especially pronounced difference for East Asian applicants. This difference may, in part, drive the observed differences in attendance rates between similarly-qualified white and Asian applicants from U.S. high schools.

**Figure S8.** Educational background of the parents of high-scoring U.S.-based applicants identifying as white or Asian. East and Southeast Asian applicants are far more likely than white applicants to have parents with undergraduate degrees from an international institution. This difference may, in part, be responsible for observed differences in attendance rates for similarly qualified Asian and white applicants. For example, attending a U.S.-based college may provide additional knowledge of how to best frame a college application for admission to a selective institution. If one parent does not hold an undergraduate degree, we only consider the undergraduate education of the other parent. The same is true for graduate degrees. We can detect whether a parent attended graduate school located in the United States if and only if the institution also has an undergraduate program. “Unknown grad” implies that the parent attended either an international graduate school, or a U.S.-based graduate institution without an undergraduate program.
